

DBMS Assignment

Scenario:

You've been assigned a task to develop a full-stack web application for a small startup called "TaskMaster." The application aims to provide users with a platform to manage their tasks efficiently, including creating new tasks, marking them as completed, and editing existing tasks.

Requirements:

Frontend Development:

Design a clean and intuitive user interface enabling users to navigate through task management functionalities seamlessly.

Implement form validations to ensure accurate input during task creation and editing.

Backend Development:

Develop a backend server using **the Framework that you have proposed to do your project**. Create APIs to handle task creation, retrieval, updating, and deletion. Utilize Django's built-in authentication system for user management and session handling.

Database Connection:

Set up a MySQL database to store user information and task data.

Establish a connection between the backend and the MySQL database.

Define appropriate database tables for storing user credentials and task details.

User Authentication:

Enable users to register with unique usernames and secure passwords.

Implement a login system to authenticate users based on stored credentials.

Task Management Module:

Develop a simple task management module allowing users to add, view, edit, and delete tasks. Display user-specific tasks on the frontend interface.

Provide options to mark tasks as completed or pending, with visual indicators for task status.
